NO.65 熱湯の方がより速く氷になる?(3)

A more recent scientific study conducted by Xi Zhang at the Nanyang Technological University in Singapore attributes the phenomenon to the chemistry between the hydrogen and oxygen molecules that make up water. The researcher believes that as the temperature rises, it provides the molecules with a lot of *pent-up energy. When this water is tossed into a cold environment, the energy jumps' out in a way similar to how a highly compressed spring would, when released. This results in the hot water cooling down much more rapidly than cold water, which does not contain as much energy.

While all these theories are plausible and explain the phenomenon under certain conditions, hone seems to provide a satisfactory universal solution to this strange physical property that has confused scientists since Aristotle observed it in 380 BCE.

---

* pent-up「抑圧された」

1	conduct	他動詞・名詞	を行う・を指揮する・を案内する・行為
2	attribute	他動詞・名詞	を(～に)帰する[to]・特質
3	feature	名詞・他動詞・自動詞	特徴・を呼び物とする・役割を果たす
4	trait	名詞	(性格・習慣などの)特色
5	hydrogen	名詞	水素
6	oxygen	名詞	酸素
7	molecule	名詞	分子
8	atom	名詞	原子
9	particle	名詞	微粒子・微量
10	fragment	名詞	破片
11	result	自動詞・名詞	終わる[in]・結果として起こる・結果
12	contain	他動詞	を含む・を収容する
13	accommodate	他動詞	を収容する・を宿泊させる
14	condition	名詞	条件・状況・状態
15	none	代名詞	どれも…ない・誰も…ない
16	universal	名詞	普遍的な・全世界の
17	confuse	形容詞	を当惑させる・を混同する
