NO.49 群集心理(2)

A simple experiment carried out in the 1950s by legendary psychologist Solomon Asch shows how common sense is influenced by peer pressure, the tendency to want to act the same as the members of one's social group. In Asch's experiment, a research participant is shown a line drawn on paper, and next to it three lines - numbered 1, 2 and 3 - one shorter, one longer and one of the same length as the original one. The participant must indicate which of the three lines corresponds to the original one. If that participant is alone in the room, he gives correct answers - unsurprising, because the task is really quite simple. Now five other people enter the room; they are all actors, a fact that the participant does not know. One after another, they give wrong answers, saying "number 1," although it's very clear that number 3 is the correct answer. Then it is the participant's turn again. In one third of cases, he will answer incorrectly to match the other people's responses. Why do we act like this?

1	phycologist	名詞	心理学者
2	philosopher	名詞	哲学者
3	influence	他動詞・名詞	に影響を及ぼす・影響・影響力
4	peer	名詞・自動詞	同僚・同等の人・凝視する
